I. 單選題 (每題5分) ※注意：請於試卷「選擇題作答區」依題號作答。

A staff member for a political campaign estimated the model $V_t = \alpha + \beta P_t + \mu_t$, for $t = 1, 2, \ldots, 22$. where V_t is voter turnout in precinct t, and P_t is the precinct's population. When the results were being printed out, the printer malfunctioned, smudging some of the results. With the information already provided, answer questions 1-6.

Coefficient	Estimate	Standard Error	t-ratio
$\hat{\alpha}$	26.034	____	14.955
$\hat{\beta}$	0.137	0.028	____
ESS=305.96	$\overline{P} = 54.478$	$s_V^2 = 31.954$	$s_P^2 = 925.91$
r_{VP} = ____	R^2 = ____	$\hat{\sigma}^2$ = ____	$\overline{V}$ = ____

Note: ESS is Error Sum of Squares.
r_{VP} is the simple correlation between V and P.

1. The standard error of $\hat{\alpha}$ is
   (A) 1.7408 (B) 1.5231 (C) 2.7233 (D) 0.2441

2. The t-ratio of $\hat{\beta}$ is
   (A) 5.244 (B) 4.893 (C) 2.144 (D) 0.204

3. The value of $\hat{\sigma}^2$ = ____
   (A) 14.570 (B) 13.907 (C) 15.298 (D) 46.295

4. The value of R^2 = ____
   (A) 0.456 (B) 0.016 (C) 0.544 (D) 0.189

5. The value of r_{VP} = ____
   (A) 0.675 (B) 0.125 (C) 0.437 (D) 0.738

6. The value of $\overline{V}$ = ____
   (A) 7.463 (B) 5.616 (C) 702.988 (D) 33.497

7. Which of the following is not a test for serial correlation?
(A) The Durbin-Watson test. (B) The Bartlett test.
(C) The Breusch-Godfrey LM test. (D) The portmanteau Q test.

8. Mean absolute percentage error (MAPE) (平均絕對百分比誤差) is defined as

$$\frac{1}{K}\sum_{t=N+1}^{N+K}\left|\frac{\hat{F}_t - F_t}{F_t}\right| \times 100$$, where $\hat{F}_t$ and F_t represent the forecast and actual values, and K is the number of forecast observations in the estimation period. The summation runs from $t = N+1$ to $N+K$. Which of the following statements about MAPE is correct ?

(A) MAPE is not very useful, because positive errors are canceled by negative errors, and the mean is always close to zero.
(B) We use MAPE when the magnitude of the error is more important than the direction of the error.
(C) MAPE penalizes large errors more sever than the root mean square error (均方根誤差) measure.
(D) MAPE is usually a better performance criterion if the actual values are close to zero.

9. A regression model is specified as $Y_t = \alpha + \beta X_t + \varepsilon_t$. If $\hat{\alpha}$ and $\hat{\beta}$ are the least square estimators of α and β and the sample mean $\bar{X}$ is zero, then

(A) $\text{cov}(\hat{\alpha}, \hat{\beta}) < 0$ (B) $\text{cov}(\hat{\alpha}, \hat{\beta}) = \infty$

(C) $\text{cov}(\hat{\alpha}, \hat{\beta})$ is indeterminate (D) $\text{cov}(\hat{\alpha}, \hat{\beta}) = 0$

10. Which of the following statements is incorrect?
(A) When the disturbances are heteroskedastic but their "average" variance in the first part of the sample is not too different from that in the second part, the Goldfield-Quandt test has a high probability of accepting H_0 when it is false.
(B) The Breusch-Pagan test has been criticized on the grounds that it is very sensitive to minor violations of the assumption of normality of the regression disturbance.
(C) Durbin developed two asymptotic (and asymptotically equivalent) tests, the *h test* and the *m test* for regression model when the explanatory variable—or one of the explanatory variables—is a lagged dependent variable.
(D) The Durbin-Watson test is not reasonably robust with respect to non-normality or heteroskedasticity of the disturbances.

II

1. The primary determinant of the amount of vacation time U.S. employees receive is their length of service. According to data released by Hewitt Associates (*Management Review*, Nov. 1995), more than 8 of 10 employers provide 2 weeks of vacation after the first year. After 5 years, 75 % of employers provide 3 weeks and after 15 years most provide to 4-week vacations. To more accurately estimate p, the proportion of U.S. employers who provide only 2 weeks of vacation to new hires, a random sample of 24 major U.S. companies was contacted. The following vacation times were reported (in days):

VACTIMES

10	12	10	10	10	10
15	10	10	10	10	10
10	10	10	10	10	15
10	10	15	10	10	10

a. Construct a 95 % confidence interval for p. （10分）

b. Is the sample size large enough to ensure that the normal distribution provides a reasonable approximation to the sampling distribution of $\hat{p}$? Justify your answer. （10分）

c. How large a sample would be required to estimate p to within.02 with 95 % confidence? （5分）

2. Each year, approximately 1.3million Americans suffer adverse drug effects (ADEs)—that is ,unintended injuries caused by prescribed medication . A study in the *Journal of the American Medical Association* (July 5, 1995) identified the cause of 247 ADEs that occurred at two Boston hospitals. The researchers found that dosing errors (that is, wrong dosage prescribed and/or dispensed) were the most common. The next table summarizes the proximate cause of 95 ADEs that resulted from a dosing error. Conduct a test (at α =.10) to determine whether the true percentages of ADEs in the five "cause" categories are different. （10分）

ADE

Wrong Dosage Cause	Number of ADEs
(l) Lack of knowledge of drug	29
(2) Rule violation	17
(3) Faulty dose checking	13
(4) Slips	9
(5) Other	27

3. Suppose the Total Sum of Squares for a completely randomized design with $k = 6$ treatments and $n = 36$ total measurements (six per treatment) is equal to 500 . In each of the following cases, conduct an F-test of the null hypothesis that the mean responses for the five treatments are the same. Use $\alpha = .10$.

   a. Sum of Squares for Treatments (SST) is 20 % of SS (Total)（5 分）

   b. SST is 80 % of SS (Total) （5 分）

   c. What happens to the F-ratio as the percentage of the Total Sum of Squares attributable to treatments is increased? （5 分）

X	+0.6745	+1.2816	+1.6449	+1.9600	+2.3263	+2.5758	+3.0902

Note: For 25 d.f., $P(\chi^2 > 37.6525) = 0.05$.
For $\nu > 100$ take

$$\chi^2 = \nu\left\{1 - \frac{2}{9\nu} + X\sqrt{\frac{2}{9\nu}}\right\}^3 \quad \text{or} \quad \chi^2 = \tfrac{1}{2}\{X + \sqrt{(2\nu - 1)}\}^2,$$

according to the degree of accuracy required. X is the standardized normal deviate corresponding to $P = 1 - Q$ and is shown in the bottom line of the table.
